**Can work with
Pandas
DataFrames**

Bokeh Is Fun!

Bokeh Basics

```
p = figure()
```

```
p.line(x=[2,3,4], y=[5,5.5,7], line_width=4)
```

Basic Plot and Glyph

Glyphs are placed by calling their respective methods

```
p = figure()  
p.line(x=[2,3,4], y=[5,5.5,7], line_width=4)  
p.circle(x=[2,3,4], y=[5,5.5,7], size=[20,30,40])
```

Multiple Glyphs

Just call more methods

id	grade	years	salary
1	3	5	75000
2	2	1	50000
3	4	10	150000
4	3	1	100000

```
source = ColumnDataSource(df)
```

DataFrame as Data Source

Quick conversion

```
source = ColumnDataSource(df)

p = figure()

p.circle(x='grade', y='years',
         size='salary', source=source)
```

DataFrame as Data Source

Quick conversion

```
source = ColumnDataSource(df)
p.circle(x='grade', y='years',
         size='salary', source=source)
```

Hover Tool

Interactive display of additional information

```
source = ColumnDataSource(df)

p.circle(x='grade', y='years',
         size='salary', source=source)

hover = HoverTool(tooltips=[("id", "@id")])
p.add_tools(hover)
```

Hover Tool

Interactive display of additional information

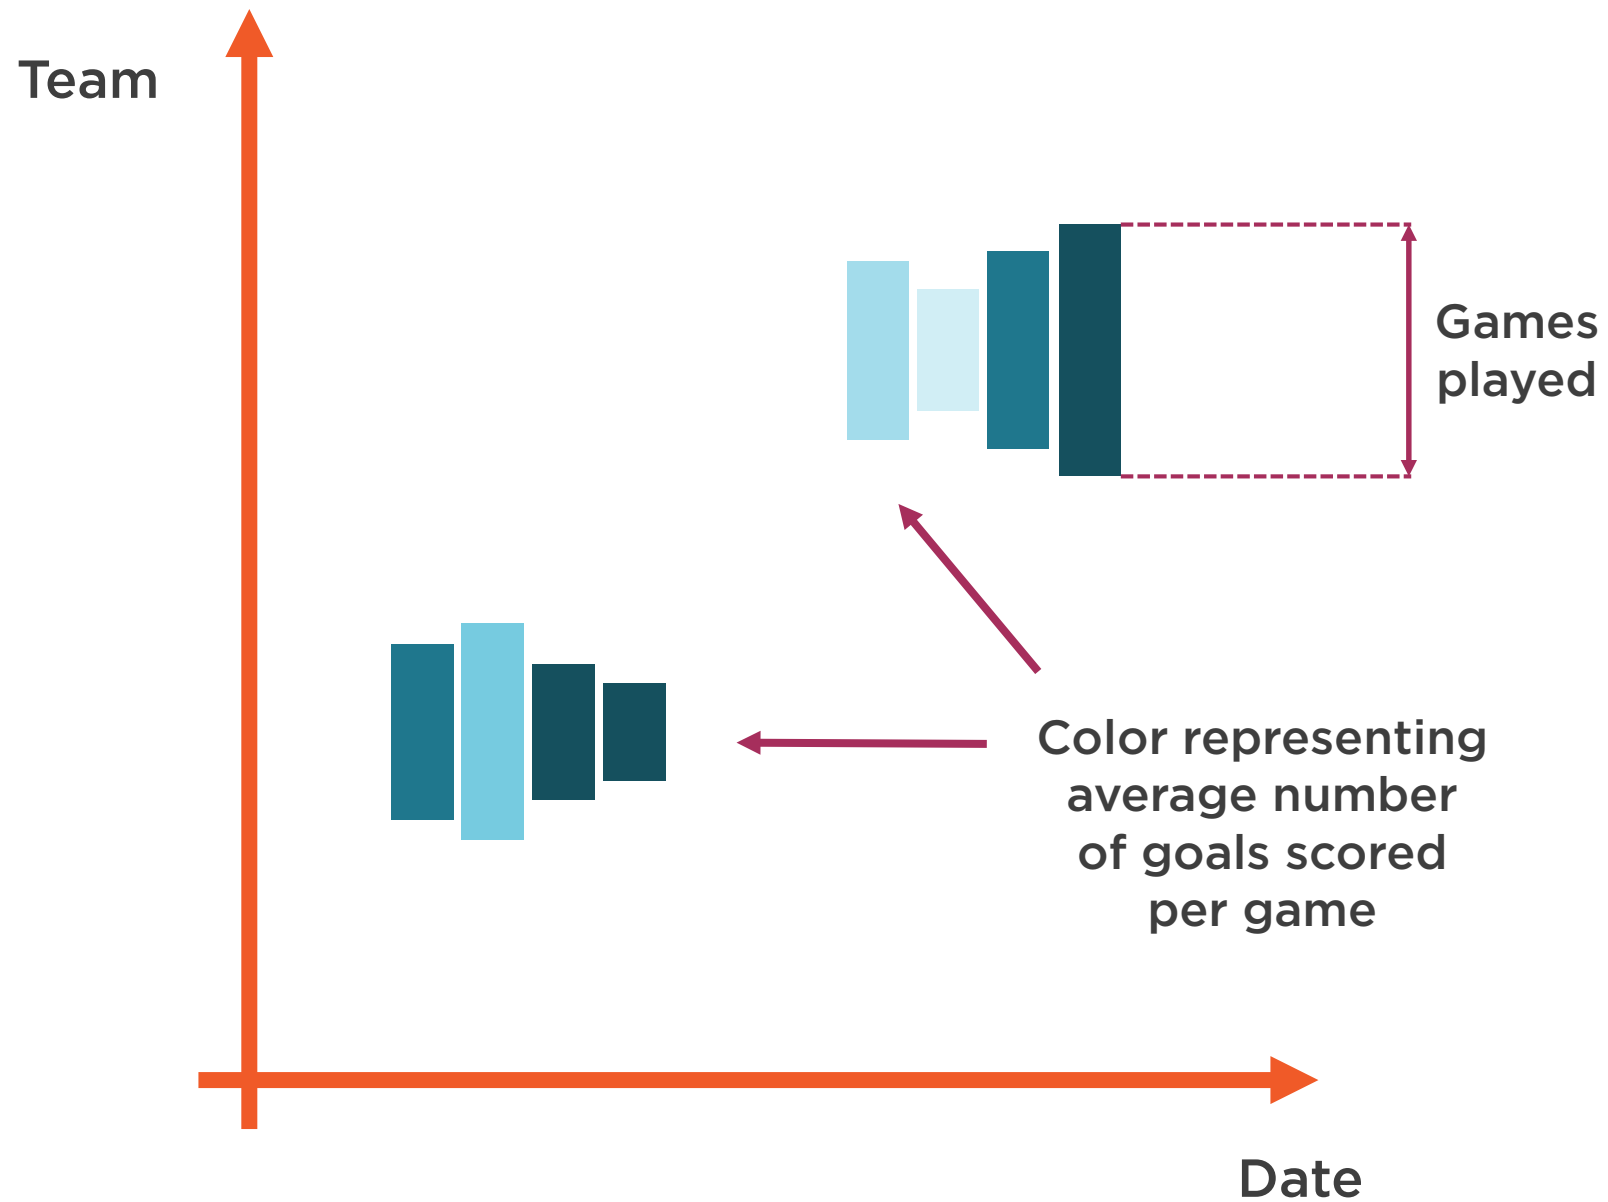

Team

Date

Summary

You are familiar with the Bokeh library

You can build complex plots from simple building blocks

You understand the importance of the right representations
